Result (content, style, target)

Result Comparison after 2000 steps (content, style, target)

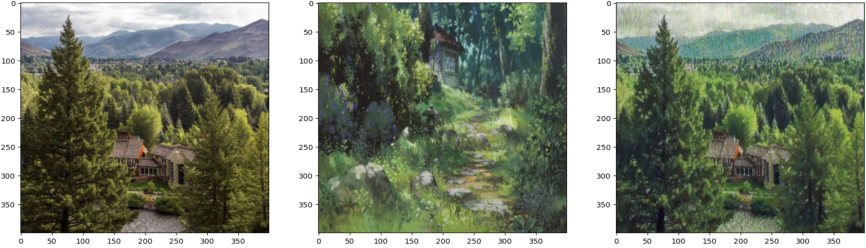

Content Weight: 1, Style Weight: 1e6

Content Weight: 20, Style Weight: 1e6

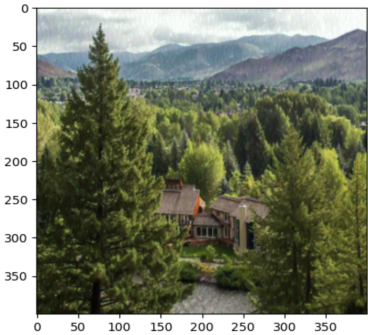

Content Weight: 1, Style Weight: 2e7

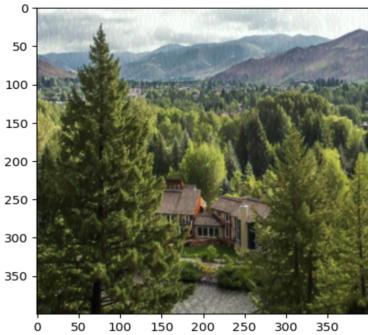

Target Result Comparison after 100 steps

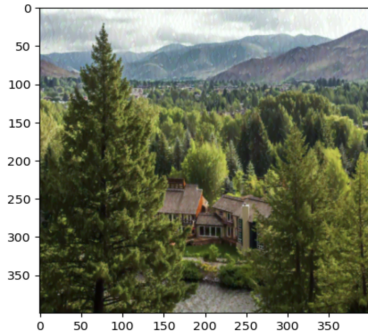

Content Weight: 1, Style Weight: 1e6

Content Weight: 20, Style Weight: 1e6

Content Weight: 1, Style Weight: 2e7

Finding

The first run is with the default content and style weight. Second run with increased content weight. Third run with increased style weight.

With the first and second run, I see very similar result in content, style and total loss. However, I do see a huge jump with total loss comparing to the third run. Even with the jump in total loss, the graph shows very similar trends between all three runs. When I look at the output image, it also looks very similar between all three runs.

Because the output image looks the same in all runs, I did another run with only 100 steps. I was hoping that with less runs, I would be able to see bigger difference, but that wasn't the case. I honestly don't understand why the result all looks very similar even though the weights are so different.
